

General Information Handbook

A fictional document created for testing a PDF RAG question-answering system

1. Document Purpose

This PDF is designed for testing a Retrieval-Augmented Generation system. The assistant should answer questions using only the information in this document. If an answer is not present in the document, the assistant should say that the information was not found in the PDF.

The information below is fictional and safe to use for practice. It includes company details, internship rules, project information, office policies, and sample facts that can be retrieved by a RAG system.

2. Organization Overview

Zizo Labs is a fictional technology training organization based in Beirut, Lebanon. It was created in 2024 to help students practice software engineering, artificial intelligence, and document automation projects.

The organization has three main teams: the Training Team, the AI Projects Team, and the Support Team. The Training Team prepares lessons and exercises. The AI Projects Team builds prototypes and experiments. The Support Team helps users with technical questions.

Item	Information
Organization name	Zizo Labs
Location	Beirut, Lebanon
Created	2024
Main focus	AI learning, Python projects, and document question answering
Main teams	Training Team, AI Projects Team, Support Team

3. Internship Information

The sample internship is a six-week training program focused on building a local RAG system for PDF documents. The program starts on Monday, 6 July 2026 and ends on Friday, 14 August 2026.

- Working days are Monday to Friday.
- The daily schedule starts at 9:00 AM and ends at 3:00 PM.
- Lunch break is from 12:00 PM to 12:30 PM.
- Interns should arrive at least 10 minutes before the starting time.
- The weekly demo meeting is every Friday at 2:00 PM.
- The internship supervisor is Lina Haddad.
- The office location is Floor 3, Beirut Training Center.

4. Required Equipment

Each intern must bring a laptop, charger, notebook, pen, and student identification card. Headphones are recommended for watching training videos or testing audio examples. A personal laptop is preferred because the project requires installing Python libraries and local AI tools.

The office provides internet access, desks, chairs, and power outlets. The Wi-Fi password is not included in this document and should be requested from the supervisor on the first day.

5. RAG Project Description

The main project is to build a local Retrieval-Augmented Generation system that answers questions from PDF files. The system should read a PDF, split the text into smaller chunks, store the chunks in a vector database, retrieve the most relevant chunks when a user asks a question, and generate an answer using only the retrieved text.

For the local prototype, the recommended tools are Python, ChromaDB, pypdf, requests, Ollama, qwen2.5:7b, and nomic-embed-text.

Tool	Role in the project
Python	Main programming language used to build the backend scripts.
pypdf	Reads text from PDF files.
ChromaDB	Local vector database that stores and searches document chunks.
Ollama	Runs local AI models on the computer.
qwen2.5:7b	Local chat model that generates final answers.
nomic-embed-text	Embedding model that converts text into vectors for semantic search.
requests	Python library used to communicate with Ollama through HTTP requests.

6. Rules for the PDF Assistant

- The assistant must answer only from the PDF context retrieved by the RAG system.
- The assistant must not invent details that are not present in the PDF.
- If the information is missing, the assistant should answer: I could not find this information in the PDF.
- The assistant should keep answers clear, short, and directly related to the question.
- The assistant should not use outside knowledge when answering questions about this document.

7. Office Rules

- The office opens at 8:30 AM and closes at 5:00 PM.
- Visitors must sign in at the reception desk before entering the training area.
- Food is allowed only in the cafeteria and not near shared computers.
- Interns must lock their screens when leaving their desks.
- API keys and private passwords must never be pushed to GitHub.
- Saturday and Sunday are non-working days.

8. Attendance and Absence

If an intern is absent, they must inform the supervisor by email before 9:00 AM. If an intern arrives late more than three times in one week, the supervisor will schedule a short meeting to discuss the issue. Remote attendance is allowed only when approved by the supervisor.

9. Expense Information

Lunch is not reimbursed. Transportation can be reimbursed up to 5 US dollars per working day if the intern provides a valid receipt. Equipment purchases are not reimbursed unless they are approved in writing before

the purchase.

10. Example Knowledge Base Facts

This section contains direct facts that are useful for testing RAG retrieval.

- The sample project name is Local PDF RAG Assistant.
- The project database is ChromaDB.
- The local chat model is qwen2.5:7b.
- The local embedding model is nomic-embed-text.
- The expected Python version is Python 3.10 or newer.
- The PDF folder name is data.
- The sample PDF file name is sample.pdf.
- The final backend can be tested from the terminal before building a web interface.
- A web interface is optional for the first prototype.

11. Information Not Included

This document does not include salary details, private phone numbers, real client names, production passwords, or confidential company data. If a user asks about one of these missing items, the RAG assistant should say that the information was not found in the PDF.

12. Sample Questions for Testing

- What is the name of the organization?
- Where is Zizo Labs located?
- What time does the internship start?
- Who is the internship supervisor?
- What tools are recommended for the local RAG prototype?
- What should the assistant answer if information is missing?
- Is the Wi-Fi password included in this document?
- What is the project database?

13. Final Note

This PDF is intentionally simple. It is made to help beginners test whether a RAG system can retrieve the correct information, avoid guessing, and answer only from the document context.
